PREFACE

The sea and all interconnected aquatic ecosystems sustain life on our blue planet and have great potential to be developed. However, these resources have experienced many natural (such as tsunamis, storms, climate change) and anthropogenic threats (such as pollution, fish exploitation, destructive fishing, land use change and coastal development). This has become a global issue and needs serious handling. Science plays an important role in exploring solutions, offering various results of scientific innovation, informing policies and management, and catalyzing change.

Marine and Fisheries National Symposium (SimNas-KP 2019) International Symposium of Marine and Fisheries (ISMF 2019) will bring together people from a wide range of scientific disciplines and origins to share their experiences, knowledge and research results to date. In addition, those symposiums will also develop and strengthen collaborations with stakeholders (national as well as international) to address issues within the context of SimNas-KP 2019- ISMF 2019 with the theme of "Managing Aquatic Resources for Sustainable Development".
