## Recommendation

Major Revision

### Would you be willing to review a revision of this manuscript?

Yes

### Comments to the Author

It appears that this articles is the first animal study analysing the anti-inflammatory effects of chitosan contained in milkfish. The articles is generally well written, but it needs further improvement at some points. Some explanations should also address major points of concern.

#### Major concern:

The main disadvantage of the article is the absence of correlation between the cytokines levels and clinical outcome. It is not clear why there is no clinical judgement of the post-extraction area. Ultimately, it is the clinical outcome that matters. Is it only IL-6 and TNF-Alpha that is important in assessment of the inflammation? Please explain why clinical and histological analysis was not performed and included in the article.

#### Other issues:

Please add the significance of the test in the tables. It cannot be concluded from the tables which differences are significant.

Please revise the language throughout the manuscript. Material and methods should be in past tense.

State the limitation of the study in the discussion section.

Do not refer to and do not explain figures in the discussion section.
